AMENDMENTS TO THE CLAIMS

Listing of Claims:

Claims 1-15 (Cancelled)

16. (Currently Amended) A halogen dioxide generating system, comprising:
- a) a source of an aqueous halogen dioxide feed solution, the source comprising means for delivering halogen dioxide salt directly to an aqueous feed solution inlet stream to locally form the aqueous halogen dioxide feed solution;
  - b) a non-membrane electrolysis cell comprising an anode and a cathode, and having a cell chamber with an inlet for receiving said aqueous feed solution stream comprising said halogen dioxide salt and an outlet for discharging effluent comprising halogen dioxide;
  - c) a passage comprising the aqueous feed solution adjacent to the anode of said non-membrane electrolysis cell; and
  - d) an electric current supply configured to provide a current through the aqueous feed solution in the passage between the anode and the cathode; ~~The halogen dioxide generating system of claim 1{,}~~ wherein the means for locally delivering halogen dioxide salt to an aqueous feed solution inlet stream comprise one or more of:
    - i) a reservoir comprising a concentrated halogen dioxide salt solution in fluid communication with the aqueous feed solution stream;
    - ii) a reservoir comprising a solid or powdered halogen dioxide salt, said reservoir configured to introduce halogen dioxide salt into the aqueous feed solution stream; or
    - iii) a halogen dioxide salt chamber comprising solid or powdered halogen dioxide salt, wherein at least a portion of the aqueous feed solution stream passes through said salt chamber wherein at least a portion of the halogen dioxide salt dissolves into the aqueous feed solution stream.

17. (Currently Amended) A halogen dioxide generating and re-circulating system, comprising:

- a) a source of an aqueous halogen dioxide feed solution, the source comprising means for delivering halogen dioxide salt directly to an aqueous feed solution inlet stream to locally form the aqueous halogen dioxide feed solution;
- b) a non-membrane electrolysis cell comprising an anode and a cathode, said anode and said cathode being separated by a non-conducting porous flow barrier, and said electrolysis cell having a cell chamber with an inlet for receiving said aqueous feed solution comprising halogen dioxide salt and an outlet for discharging effluent comprising halogen dioxide, wherein said anode comprises a plurality of porous flow passages through which at least a portion of the aqueous halogen dioxide feed solution flows in a cross direction to a flow of electricity between the anode and the cathode, and wherein said porous flow barrier is structured and arranged to restrict flow of the aqueous feed solution through the cell chamber in a cross direction to the flow of electricity between the anode and cathode, thereby increasing a proportion of aqueous halogen dioxide feed solution that flows through the anode;
- c) a passage formed through at least a portion of said porous anode and at least a portion of said non-conducting porous flow barrier;
- d) an electric current supply configured to provide an electric current that flows between the anode and the cathode in a cross direction to the flow of the aqueous feed solution through the porous anode and the cell chamber wherein the current converts a portion of the halogen dioxide salt in the passage to halogen dioxide, and thereby forms an aqueous effluent comprising halogen dioxide; and
- e) at least one return passage configured for returning one or more of i) depleted effluent comprising reverted halogen dioxide salt and ii) at least a portion of the aqueous effluent from the cell chamber back to said aqueous feed solution inlet stream; ~~The halogen dioxide generating and re-circulating system of claim 9{,}~~  
wherein the means for locally delivering halogen dioxide salt to an aqueous feed solution stream comprise one or more of:
  - i) a reservoir comprising a concentrated halogen dioxide salt solution in fluid communication with the aqueous feed solution stream;

- ii) a reservoir comprising a solid or powdered halogen dioxide salt, said reservoir configured to introduce halogen dioxide salt into the aqueous feed solution stream; or
- iii) a halogen dioxide salt chamber comprising solid or powdered halogen dioxide salt, wherein at least a portion of the aqueous feed solution stream passes through said salt chamber wherein at least a portion of the halogen dioxide salt dissolves into the aqueous feed solution stream.

Claims 18 and 19 (Cancelled)
